**AIR AMBULANCE ROTARY-WING (NON-CRITICAL CARE)**

**DESCRIPTION**
An Air Ambulance Rotary-Wing (Non-Critical Care Transport) is a helicopter that provides basic life support (BLS)-level or advanced life support (ALS)-level care and rapid transportation of patients from scenes, established pick-up sites, or medical facilities to medical facilities to medical facilities (typically located within 150 miles of the disaster area). It does not transport critical care patients unless the Aeromedical Transport Manager determines it to be necessary. The range of transport varies by several factors, such as capabilities and configuration of the individual aircraft, capabilities of the pilot, qualifications of the medical crew, and environmental/weather conditions.

**RESOURCE CATEGORY**
Emergency Medical Services

**RESOURCE KIND**
Aircraft/Team

**OVERALL FUNCTION**
The Air Ambulance Rotary-Wing (Non-Critical Care Transport):
1. Provides emergency medical care, evacuation, and transportation services via rotary-wing aircraft from scene, established pick-up site, or medical facility to medical facilities
2. May import personnel, equipment, and supplies (including blood products) into the area of need

**COMPOSITION AND ORDERING SPECIFICATIONS**
1. Discuss logistics for deploying this resource, such as working conditions, length of deployment, security, lodging, resupply of medical services, transportation, and meals prior to deployment
3. Requestor will provide transportation (including patient care personnel to and from the landing zone (LZ) for the sending and receiving medical facilities), food, and rest facilities unless other arrangements exist
4. Provider confirms an LZ of sufficient access and security to ensure the safety of the air and ground personnel, victims, spectators, and other on-site individuals
5. Requestor may order backup supplies and equipment, depending on number of patients and type of event
6. Requestor can order an Aeromedical Transport Manager for administrative and logistics support
7. Requestor should provide number of patients, passengers, and their weights, transport distance, and equipment requirements
8. Requestor should specify personnel required to transport patient based on patient acuity
9. This team does not provide transport of patients with infectious diseases as it requires specialized teams and equipment compliant with Centers for Disease Control and Prevention (CDC) guidance

Each type of resource builds on the qualifications of the type below it. For example, Type 1 qualifications include the qualifications in Type 2, plus an increase in capability. Type 1 is the highest qualification level.
